Name: **Roll No:** **Batch:**

Paragraph Unity

Task 1: The sentences for each paragraph given below are not in the correct order. Rearrange them to form a coherent and unified paragraph. The paragraph should have a clear topic sentence, logically connected supporting sentences, and a suitable concluding sentence. Pay attention to the way each sentence develops the main idea.

Paragraph-1

A. It can also help learners understand the customs, values, and perspectives of people from different cultures.
B. For example, learning Hindi, Spanish, or Japanese can make it easier to communicate with people who speak those languages.
C. Learning a new language is a valuable skill that can improve communication and broaden a person's understanding of the world.
D. As learners become familiar with new words and expressions, they gradually become more comfortable communicating in unfamiliar situations.
E. This increased cultural awareness can make people more respectful and open-minded when interacting with others.
F. In addition, knowing another language can create opportunities for education, travel, and employment.
G. Therefore, learning a new language is not merely about memorising vocabulary; it is a way of developing communication skills and connecting with people beyond one's immediate surroundings.

Answer: _____

Paragraph – 2

A. A curious learner is more likely to ask questions, seek explanations, and explore a subject beyond the information provided in class.
B. Curiosity plays an important role in learning because it encourages people to explore questions and seek new knowledge.

C. For example, a student who becomes interested in how artificial intelligence works may begin reading articles, watching lectures, or experimenting with simple tools independently.

D. This willingness to investigate can lead learners to make connections between ideas and develop a deeper understanding of a subject.

E. Curiosity can also make learning more enjoyable because learners become actively involved in discovering answers rather than simply receiving information.

F. Over time, such habits can encourage independent learning and develop the ability to think critically about unfamiliar problems.

G. Therefore, curiosity is more than a natural desire to know something; it is an important quality that can make learning deeper, more active, and more meaningful.

Answer: _____

Task 2: Provide a clear topic sentence and rearrange the sentences to make it a unified paragraph. Omit sentences that do not support the main idea of the paragraph.

Paragraph 1:

Different flavours can be combined in many ways. In addition, cooking can be a rewarding activity because preparing a meal for ourselves or others can create a sense of achievement. Some people learn to cook when they begin living away from their families. Cooking classes are also offered in many places. Cooking teaches us how to select ingredients, follow instructions, manage time, and prepare meals safely. It also encourages creativity because a cook can experiment with different ingredients, flavours, and methods of preparation. For example, a person who learns to cook can gradually move from preparing simple dishes such as omelettes and sandwiches to making more elaborate meals. Many television channels now broadcast cooking competitions featuring professional chefs from different countries. Thus, learning to cook is not merely about preparing food; it develops practical skills, independence, creativity, and confidence. Learning to prepare our own food can also help us make more informed choices about what we eat and develop healthier eating habits.

Paragraph 2:

Learners can attend classes, access study materials, submit assignments, and communicate with teachers through digital platforms from different locations. This flexibility is particularly useful for students who live far from educational institutions or have work and family responsibilities. Many universities also organise seminars, workshops, and cultural programmes for students on campus. Distance education also allows learners to study at their own pace and revisit recorded lessons when necessary. However, it requires

self-discipline, effective time management, and regular participation. Overall, distance education can make learning more accessible, flexible, and convenient for a wide range of learners.

Task 3: The following paragraph contains short, monotonous, simple sentences. Rewrite the paragraph, varying the sentence structure. Some sentences will be combined. Use a separate sheet of paper.

Experiential learning is a useful way of learning. Students can take part in experiments and field visits. Students can observe things directly. Students can also take part in internships and community projects. They can use what they learn in real situations. These activities help students understand ideas more clearly. Experiential learning can make education more meaningful.

_____

_____

_____

_____

Task 4: Read each paragraph carefully. From the sentences given below, select the sentence that best supports the main idea of each paragraph. Rewrite the paragraphs by inserting the appropriate supporting detail in the correct place.

The Changing Classroom: From Tradition to Transformation

Traditional education often follows a teacher-centred approach in which the teacher plays the primary role in explaining lessons and providing information. Students are generally expected to listen carefully, take notes, and reproduce what they have learned in examinations. This approach places considerable importance on discipline, regular attendance, and respect for the teacher's authority.

Contemporary education gives greater importance to active participation and student-centred learning. Instead of simply listening to lectures, students may work in groups, participate in discussions, conduct projects, and solve problems collaboratively. The teacher increasingly acts as a facilitator who guides students rather than being the only source of knowledge.

Assessment in traditional education is often closely connected with examinations and the ability to reproduce information accurately. Students may spend considerable time preparing for tests that determine

their academic performance. Success is therefore often measured by how well students remember and reproduce the material taught in class.

Contemporary education has been significantly influenced by technology and the easy availability of information. Students can use digital libraries, educational websites, videos, and online courses to explore subjects beyond their classroom. As a result, learning is no longer restricted to the physical classroom or to the information provided by a single teacher.

1. Assessments may include presentations, projects, portfolios, group activities, and continuous evaluation**.**
2. Students often resort to rote-learning because examinations required them to recall large amounts of information.
3. Many classrooms use smart boards, online resources, and educational applications to make lessons more interactive.
4. These classrooms often depends heavily on textbooks and blackboards as the main sources of learning.
